

Drive efficiency by mapping your data.

Learn what CityView's seamless GIS integration can do for you.

By integrating your CityView Suite with your existing GIS provider, such as Esri, you can drive efficiency, visualize data and automate business processes; here's how:

Drive efficiency

Our deeply integrated GIS capabilities allow municipal staff to quickly locate a job location on a map; measure distance, boundaries and areas; create buffer selections for mailing lists; kick-off permit and other processes from the map and spatially analyze the surroundings of subject properties.

Visualize data

By integrating spatial awareness and routing capabilities into your CityView Mobile solution, inspectors can quickly and easily see where their inspections are on a map so that they can plan their most efficient route, saving both time and money. Not only that, but they can also view search results on a map.

Automate business processes

Use spatial queries to drive efficient business processes. For example, assign inspectors based on the property location. Plus, automatically generate correspondence to select properties based on GIS information.

CityView's integration expertise lowers the total cost of ownership by providing tight integrations with other CityView applications, a seamless end-user experience when integrating with third-party products and flexibility for customers to maintain their systems of choice. Some integrations to note include:

- Microsoft Outlook Add-In
- Microsoft Word Add-In
- Electronic Document Management Systems (EDMS)
- Bluebeam for paperless plan reviews
